

## **METHOD FOR REMARKING IMAGE TAKEN BY DIGITAL CAMERA**

### **ABSTRACT OF THE DISCLOSURE**

A method for remarking image taken by digital camera involves an image-sensing element, a sound-sensing element, a logic element, and an output element. The method is performed through the logic element to edit video/audio signals caught by the image-sensing element and the sound-sensing element into a link file in the format compatible with a web browser. At this moment, a plurality of image data and corresponding remarking sound data are assigned and stored at once, so that a user can view a selected image data and listen to a corresponding remarking sound data synchronously when the link file is opened by the web browser.
